Dear Hiring Team,

I am a Staff Software Engineer at Adobe with 8+ years of experience building enterprise software. I partner with engineering, product, and design to set technical direction and deliver customer-facing capabilities in Adobe GenStudio for Performance Marketing.

I lead engineering for content creation and editing, helping enterprise marketers generate, customize, and scale on-brand ads. I led a redesign using the collaborative canvas platform that also powers Adobe Express and guided technical direction for Carousel Ads and multi-channel draft creation. I also implemented GenStudio's ChatGPT Ads creation experience and partnered across teams to bring it to general availability.

My background spans full-stack product engineering, distributed systems, data integrations, and developer platforms. Previously, I architected a data-platform redesign for GenStudio Insights and ad activation using Apache Airflow and a custom ETL pipeline, and built cloud asset-processing capabilities for Adobe Experience Manager. I share engineering lessons through Adobe Summit, API World, Adobe Developers Live, and technical writing.

I build reusable Claude and GitHub Copilot skills that connect agents to engineering and observability tools, and contribute to autonomous issue-resolution workflows. I also built server-side document-creation capabilities that became a foundation for agent-driven creative workflows and MCP integrations. This work reflects how I approach AI: start with a real user problem, respect production constraints, and build useful tools.

I would be excited to bring my experience building enterprise software, mentoring engineers, and guiding cross-functional delivery to your team. Thank you for your consideration.

Sincerely,

Jamie Delbick
